

Routines and Automation

For many years science fiction stories have heavily incorporated robotics and other automated systems, whether that be dystopian worlds run by soulless machines or technological marvels where human lives are made simple by automating everyday tasks.

Aspects of these futures have also been creeping into the real world as spectacular demonstrations from world-leading technology companies. More and more though, these pieces of technology are starting to transition from just being expensive showcases in industry expos to affordable products that you and I can incorporate into our everyday lives.

Technology is slowly changing our lives, from cars driving themselves to fridges automatically creating shopping lists. One of the most significant changes is going to be in the workforce of tomorrow, starting with the automation of routine tasks.
