

***FLOW* BLOCKS:**

COMPARISONS

Pt II

As you have already learnt, a comparison statement is when you compare two different values using a comparison operator. This statement will either be correct and return TRUE or incorrect and return FALSE. Here are two more comparison blocks that may be useful in this subsystem:

EQUAL

Compares two different inputs. If the inputs have the same value, it returns the boolean value TRUE. Otherwise, it returns the boolean value FALSE.

NOT EQUAL

Compares two different inputs. If the inputs DO NOT have the same value, it returns the boolean value TRUE. Otherwise, it returns the boolean value FALSE.
